I have two questions: How does the probability of event A occur in the interval $[0,a]$ equal the product of two of the probability of the interval $[0,a/2]$ and $[a/2,a]$. Is there a nice way to prove that? Is there any easy way to find the probability mass function of the sum of two uniform distributions? I.e. what is the probability mass function of the event that the sum of two independent, uniform random variables is in the interval $[0,a]$? Thanks, A: To answer question 1, we need to think about how addition works. The probability that the sum of two uniform distributions SX,YS is in $[0,a]$ is the same as the probability that SXS is in $[0,a/2]$ and SYS is in $[a/2,a]$, i.e., $P(X+Y \in [0,a]) = P(X \in [0,a/2]) \cdot P(Y \in [a/2,a])$ (by the independence of SXS and SYS). Thus we need to find 1d6a3396d6
