Free Fundamentals Of Computers Fundamentals Of Computer Fundamentals Of Computers Fundamentals Of Computers Fundamentals Of Computers Fundamentals Of Computers Fundamentals Of Computers Fundamentals Of Computers Fundamentals Of Computers Fundamentals Of Computers Fundamentals Of Computers Fundamentals Of Computers Fundamentals Of Computers This invention relates to a method of working a mineral-containing material, particularly a coal-containing material, to remove mineral-containing particles therefrom, and to an apparatus for performing this method. Heretofore, to remove the mineral-containing particles from mineral-containing material, e.g., coal, a caustic material, e.g., caustic soda or caustic potash, is mixed with the mineral-containing material, and the mixture is blown upward by a blower, e.g., a fan. Mineral-containing particles adhering to the surface of the blower are separated by the air moving upwardly past the blower. A dust-removal screen may be provided in the path of the air above the blower. The quantity of mineral-containing particles removed by the aforementioned method is approximately proportional to the quantity of caustic material applied to the mineral-containing material. Although the method is satisfactory for removing relatively large particles, it is not satisfactory for removing small particles or particles having a size ranging up to approximately 100 microns. When the mineral-containing material is coal, the coal adsorbs caustic material, and the caustic material is partially neutralized by the coal. The neutralized mineral-containing particles are removed by the dust-removal screen. If the coal and the caustic material are not appropriately mixed prior to application to the mineral-containing material, i.e., if the blower is not properly mixed with the mineral-
