In U.S. Pat. Nos. 6,395,201 and 7,022,826, the disclosures of which are incorporated herein by reference, it was reported that a ratio of cellulose to lignin of about 10:1 yielded the highest yield of ethanol from the cellulose. However, the high lignin content caused a reduction in the water permeability of the cellulose. Thus, there is a need in the art for a process of making a cellulose ethanol system that can overcome the problems of high lignin content and low water permeability of the cellulose. In these references, a method of culturing plants was developed to produce high yields of cellulose from plant biomass. In the process, biomass is processed to produce an aqueous composition for culturing plants that has a pH of about 6.5 or less and contains about 100 ppm to 500 ppm of sodium carbonate. It is believed that the pH of the aqueous composition serves to protect the plants from pathogens that may be present in the plants. The aqueous composition may further contain other nutrients and the like. The aqueous composition is used to culture plants until they are harvested. The harvested plants are then harvested from the culture medium and allowed to dry for about 5 to 30 minutes. The dried plants are then defibered by grinding, for example, to a particle size of about 1 mm to about 5 mm. The ground plant biomass is then treated to extract a cellulose-containing product. The extraction process includes steps of mixing the ground plant biomass with a solvent and separating the solvent from the ground plant biomass. After the solvent has been separated from the ground plant biomass, the solvent is removed from the ground plant biomass to form a cellulose-containing product. As increasingly powerful robots get smaller, robots that fold themselves and weave themselves out of materials will soon be put to work. "We're at the point where we're going to be able to drop all the robotics at the molecular level," David R. Baker, a program director at the Defense Advanced Research Projects Agency, said at the National ca3bfb1094
